Collaboration Diagram — AI Cost Autopilot

The same chat completion as the sequence diagram, organised by who is linked to whom. Decimal numbers give the order and nesting of messages.

How to read it

Boxes are objects (name : class, underlined). A line is a link: the objects can reach each other. The small arrow before each message gives its direction.

Numbers nest: 1.4.1 runs inside 1.4. On a cache hit, 1.6a and 1.7a replace 1.6 to 1.10, so no trim and no provider call happen. Message 3 then repeats the 1.x messages.

Guards in [ ] must hold for the message to be sent. * means repeated. A return value follows a colon, as in lookup(original): hit.

Secret detected: plan.use_cache is False, so 1.5 and 1.8 are skipped; 1.6 can still run when the request is code-heavy and over the 1000-token threshold.

The cache is keyed on the original request (1.1), never the trimmed one, so a trimmed request can still be reused later.
